

Solder on pins should look concave. NOT BALLS. Use your soldering iron to wick away excess solder.

Your cap maybe 47uF cause that's what I had although the adafruit tutorial recommends 100uF 16V.

The resistor color band for 10K is brown-black-orange. The last color (gold in this picture) indicates tolerance (1%, 5%, etc).

Soldering the accelerometer board $\sim 1/8$ " above the PCB keeps the pins looking nice on the bottom.

These

5.08mm screw terminals slide together.

Choose
whichever color LEDs you like. The longer lead is positive.

The notch in the LED is negative and matches the notch in the silkscreen.

The current

limiting resistors for the LEDs is 220ohms. The color band for 220 is red-red-black.

Break the male headers into 14 pins to match the length of the uController and solder the pins to the uController.

Break 2 pins off the 16pin male headers to get 14 pins is all you need. You're Done.

We're not going to solder the rest of the parts unless we have more time or you want to do extra.
